

# Non-peptide Inhibitors of Proprotein Convertase Subtilisin Kexins PCSKs Colloquium Series on Protein Activation and Cancer

Filesize: 6.27 MB

## ***Reviews***

*This ebook can be worthy of a read, and much better than other. I have read and i am certain that i am going to planning to go through again once again in the future. You may like just how the writer compose this book.*

*(Mr. Grant Stanton PhD)*

## NON-PEPTIDE INHIBITORS OF PROPROTEIN CONVERTASE SUBTILISIN KEXINS PCSKS COLLOQUIUM SERIES ON PROTEIN ACTIVATION AND CANCER

Morgan & Claypool Life Sciences. Paperback. Book Condition: New. Paperback. 76 pages. Dimensions: 9.2in. x 7.5in. x 0.2in. The Ca<sup>2+</sup>-dependent mammalian Proprotein Convertase Subtilisin Kexins (PCSKs) or Proprotein Prohormone Convertases (PCs) are a family of endoproteases that play critical roles not only in normal development and metabolism but also in various physiological and pathological conditions. These were initiated by the proteolytic processing of large inactive proproteins into their shorter bioactive mature forms by the PCSK enzymes. These events take place in a highly selective, orchestrated, and stepwise manner. Among the various proprotein substrates of PCSK enzymes, particularly important are the precursor growth factors that include proPDGF-A, B, proIGF-1, 2 and proVEGF-C because of their strong implications in neoplasia initiation, progression, and metastasis. As a result of these findings, PCSK enzymes, particularly furin or PCSK3, became a major target for possible interventions of cancer via the use of their selective inhibitors. Significant progress has been accomplished in the development of peptide and protein-based PCSK inhibitors. However, non-peptide PCSK9 inhibitors are more preferable because of their drug-like and other characteristics. So far, a few non-peptide inhibitors of PCSK enzymes of various types of chemical structures have been described in the literature. These include (i) Carbocyclic compounds of diterpene and streptamine class. (ii) Nitrogen (N)-based heterocyclic compounds of various types and chemical structures such as (a) pyrrolidine bis piperazines, (b) CuZn chelating terpyridine derivatives; (iii) Oxygen (O)-based Heterocyclic compounds of varying types of chemical structures such as (a) Flavonoids, (b) Coumarins of simple and dimeric types, (c) Quinonoids, (d) Iridoids; (iv) Aromatic compounds such as (a) Aryl guanidino and amidino derivatives, (b) Naphthyl fluorescein derivative, and (c) Phenyl Arsonic acids; and (v) C<sub>2</sub>-symmetrical aromatic azo-compounds. When measured against a small peptidyl-MCA fluorogenic substrate, these inhibitors displayed IC<sub>50</sub> values ranging from nM to M. A...
